ASSINMENT PART 2

1. Introduction

The purpose of this project was to improve the visual appearance, layout and responsiveness of the Mpho's Bakery website. The website was developed using HTML for the page structure and an external CSS stylesheet for the design. The final website contains five pages: Home, About Us, Products, Enquiry and Contact.

2. Website Pages

index.html – Home page containing the bakery introduction and popular products.

about.html – Provides information about Mpho's Bakery, including its mission, vision and values.

products.html – Displays the bakery products such as cakes, cupcakes, bread and biscuits.

enquiry.html – Contains a form that customers can use to make an enquiry.

contact.html – Provides contact information, business hours, two locations and a contact form.

3. External CSS Stylesheet

I created one external stylesheet called `css/style.css` and linked it to all five HTML pages. Using one stylesheet keeps the design consistent across the website and makes future changes easier because the styling can be updated in one place.

4. Base Styling and CSS Reset

A CSS reset was used to remove default browser margins and padding and to apply box-sizing: border-box. I also set a consistent font family, font size, line height, text colour and background styling. This creates a consistent starting point for all pages.

5. Typography

The website uses CSS typography rules such as font-family, font-size, font-weight, line-height and letter-spacing. Different heading sizes were used to create a clear typography hierarchy. This makes headings, paragraphs and navigation easier to read.

6. Page Layout

Flexbox was used for the navigation so that the menu items can be arranged neatly and adapt to different screen sizes. CSS Grid was also used for the main page layout and content sections. This helps organise the website into a clear and structured layout.

7. Colours and Visual Design

A consistent colour scheme was applied to the header, navigation, sections, buttons and other elements. Borders, rounded corners and box shadows were used to improve the visual appearance of content areas and product sections without making the pages difficult to use.

8. Interactive States

Interactive pseudo-classes were added to important controls. The navigation links and buttons use `:hover`, `:focus` and `:active` states. These states give the user visual feedback when interacting with the website and the focus styling also helps keyboard users identify the selected control.

9. Responsive Design

The website was designed to work on desktop computers, tablets and mobile phones. Media queries were used to change the layout at different screen sizes. The desktop layout can use multiple columns, while smaller screens use a more compact single-column layout where appropriate.

10. Breakpoints Used

Small phones: up to 480px.

Mobile: up to 767px.

Tablet: 768px and above.

Desktop: 1024px and above.

11. Relative Units

Relative units such as `rem`, percentages and viewport-based sizing were used in the CSS. These units help elements and text adapt better to different screen sizes instead of relying only on fixed pixel measurements.

12. Responsive Images

The product images were made responsive so that they do not overflow their containers. The image elements also use srcset and sizes attributes where applicable. This allows the browser to select a suitable image size depending on the available display area.

13. Forms

The enquiry and contact forms were styled using the external CSS stylesheet. Inputs, labels, text areas and buttons were given consistent spacing, borders and focus states. The forms were also adjusted for smaller screens so they remain usable on mobile devices.

14. Testing and Developer Tools

The website should be tested using browser Developer Tools and responsive device mode. The layout can be checked at desktop, tablet and mobile viewport sizes. During testing, I would check navigation, images, forms, spacing, text readability and whether any content overflows the screen.

15. Part 1 Feedback

Part 1 Feedback: No feedback was provided.

16. Changelog

Created and linked the external css/style.css stylesheet to all pages.

Added CSS reset and consistent base styling.

Added typography rules and a clear heading hierarchy.

Added Flexbox navigation and Grid-based layout.

Added colours, borders, rounded corners and box shadows.

Added :hover, :focus and :active interactive states.

Added responsive breakpoints for mobile, tablet and desktop.

Added relative units such as rem and percentages.

Added responsive image srcset and sizes attributes.

Improved form styling and mobile form layout.

Updated the README with Part 2 information and the changelog.

17. Conclusion

The final Mpho's Bakery website uses HTML and external CSS to provide a consistent and responsive user experience. The styling, navigation, forms, images and page layouts were improved to work across different screen sizes. The project also includes a README and changelog documenting the work completed for Part 2.
